

# Frank Schlehofer

Peoria, AZ | 630-484-4139 | [frankschlehofer@gmail.com](mailto:frankschlehofer@gmail.com) | <https://frankschlehofer.github.io>

## EDUCATION

---

|                                                                   |                       |
|-------------------------------------------------------------------|-----------------------|
| <b>Purdue University</b> , West Lafayette, IN                     | December 2026         |
| Bachelor of Science, Master of Science in <b>Computer Science</b> | <b>GPA: 3.99/4.00</b> |

**Relevant Coursework:** Data Communication and Networks, Compilers, Analysis of Algorithms, Data Mining and Machine Learning, Artificial Intelligence, Data Structures and Algorithms, Systems Programming, Computer Architecture, Relational Databases, Object-Oriented Programming, Discrete Math, C Programming, Statistics, Probability, Linear Algebra

## SKILLS

---

**Programming:** Java, C, C++, Python, JavaScript, SQL, HTML, CSS, x86 Assembly, Yacc, Lex, Swift  
**Frameworks/Tools:** React, Node, Express, PostgreSQL, Git, GitHub, Agile, OpenCV, TensorFlow, PyTorch, Pandas, LLVM  
**Technologies:** AWS, Google Cloud Vision API, LaTeX, Supabase, Render, Vercel, Netlify

## EXPERIENCE

---

|                                                           |                    |
|-----------------------------------------------------------|--------------------|
| <b>Software Engineering Intern – Garmin International</b> | May 2026 – Present |
|-----------------------------------------------------------|--------------------|

- Architected features for internal automation tooling using Python to accelerate complex data transformations, streamline development workflows, and enhance overall engineering efficiency.
- Optimized core internal automation workflows by designing and implementing structural enhancements that reduced data lookup times by 500%, significantly accelerating key engineering functions.
- Instituted rigorous software testing methodologies by developing comprehensive unit, integration, and regression tests, guaranteeing the high-fidelity validation of critical aircraft performance datasets prior to deployment.

|                                                             |                    |
|-------------------------------------------------------------|--------------------|
| <b>Undergraduate Teaching Assistant</b> , Purdue University | Jan 2025 – Present |
|-------------------------------------------------------------|--------------------|

*Foundations of C, Object-Oriented Programming (Java)*

- Mentored and instructed a cohort of 700+ students on foundational C and Java concepts through 3+ weekly office hours and lab sessions.
- Graded and provided individualized feedback on over 2,500 programming assignments, identifying common errors to help improve departmental teaching materials.
- Directly assisted an average of 30+ students per week with complex topics including memory management in C, polymorphism in Java, and algorithmic debugging.

## PROJECTS

---

|                                                                                |                          |
|--------------------------------------------------------------------------------|--------------------------|
| <b>SlayerHiL Hardware-in-the-Loop Testing and Flight Simulation   C++, Git</b> | September 2025 – Present |
|--------------------------------------------------------------------------------|--------------------------|

- Accelerated development and validation of a custom quadcopter flight controller by contributing to a HIL simulation platform, enabling rapid and safe automated firmware testing.
- Led an 8-person flight simulation team, engineered a physics engine entirely from scratch, implemented a rigid-body dynamics model based on Newton-Euler equations to accurately simulate 6-DoF motion.
- Programmed realistic propulsion model to translate flight controller's motor commands into precise forces and torques required for flight which form the deterministic core of the simulation environment.
- Implemented numerical integration methods to solve Newton-Euler equations of motion, processing 1,000+ physics updates per second to ensure real-time performance.

|                                                                             |                        |
|-----------------------------------------------------------------------------|------------------------|
| <b>Frankie's Fridge   Node, React, Express, REST API, Agile, JavaScript</b> | March 2025 – July 2025 |
|-----------------------------------------------------------------------------|------------------------|

- Developed full-stack web application, using Node.js and Express for backend server with RESTful API endpoints, PostgreSQL for persistent and scalable data storage, and React.js styled with CSS for intuitive fridge UI.
- Drove user adoption to 30+ active registrations within the first month post-launch through LinkedIn marketing.
- Integrated Google Cloud Vision API to enable image-based ingredient recognition, reducing manual user input by an estimated 75% and enhancing the core user experience.
